

Objective: Make a website that takes the user's face as input and searches the internet for appearances of the user. The search would run every (week) and notify the user of new occurrences of their face, and their locations.

Plan:

1. Create a user interface where the user can upload multiple photos of themselves (possibly with instructions for clarity of photo)
2. Use facial recognition software to create a profile of the user's face
3. Search the internet (social media, google images, etc) for occurrences of the user's face and report the specific locations to the user (possibly with a link)
4. Maybe include general tips on how to work to get photo removed from a specific site or account
